HELP Seminar

October 13, 2026

Motivation

- Childbirth often **costly** for firms
  - Replacement costs, maternity benefits, productivity disruptions (Gallen, 2019; Ginja et al., 2023...)

Motivation

- Childbirth often **costly** for firms
  - Replacement costs, maternity benefits, productivity disruptions (Gallen, 2019; Ginja et al., 2023...)
- Firms may respond to **realized fertility** (Goldin, 1990; Waldfogel, 1998; Kleven et al., 2024...)

Motivation

- Childbirth often **costly** for firms
  - Replacement costs, maternity benefits, productivity disruptions (Gallen, 2019; Ginja et al., 2023...)
- Firms may respond to **realized fertility** (Goldin, 1990; Waldfogel, 1998; Kleven et al., 2024...)
- Firms may also **anticipate** future fertility costs
  - Contribute to substantial gaps observed even before childbirth (Gallen, 2023; Folke et al., 2026; Landais et al., 2026...)

Motivation

- Childbirth often **costly** for firms
  - Replacement costs, maternity benefits, productivity disruptions (Gallen, 2019; Ginja et al., 2023...)
- Firms may respond to **realized fertility** (Goldin, 1990; Waldfogel, 1998; Kleven et al., 2024...)
- Firms may also **anticipate** future fertility costs
  - Contribute to substantial gaps observed even before childbirth (Gallen, 2023; Folke et al., 2026; Landais et al., 2026...)
- Employers infer future fertility from **observable characteristics**

Motivation

- Childbirth often **costly** for firms
  - Replacement costs, maternity benefits, productivity disruptions (Gallen, 2019; Ginja et al., 2023...)
- Firms may respond to **realized fertility** (Goldin, 1990; Waldfogel, 1998; Kleven et al., 2024...)
- Firms may also **anticipate** future fertility costs
  - Contribute to substantial gaps observed even before childbirth (Gallen, 2023; Folke et al., 2026; Landais et al., 2026...)
- Employers infer future fertility from **observable characteristics**

→ **Expected-Fertility Discrimination** (EFD)

- Childbearing-age women treated differently because of expectations on their future fertility, *regardless* of actual future fertility

Motivation

- Childbirth often **costly** for firms
  - Replacement costs, maternity benefits, productivity disruptions (Gallen, 2019; Ginja et al., 2023...)
- Firms may respond to **realized fertility** (Goldin, 1990; Waldfogel, 1998; Kleven et al., 2024...)
- Firms may also **anticipate** future fertility costs
  - Contribute to substantial gaps observed even before childbirth (Gallen, 2023; Folke et al., 2026; Landais et al., 2026...)
- Employers infer future fertility from **observable characteristics**

→ **Expected-Fertility Discrimination** (EFD)

- Childbearing-age women treated differently because of expectations on their future fertility, *regardless* of actual future fertility

- Key to understand why gender discrimination arises and how to address it

Identifying discrimination is always hard, more so for EFD

- **Disparate treatment**: expected fertility $\stackrel{?}{\Rightarrow}$ employer decision

Identifying discrimination is always hard, more so for EFD

- **Disparate treatment**: expected fertility $\overset{?}{\Rightarrow}$ employer decision
  - Identification: isolate the **causal effect** of fertility expectations on decisions

Identifying discrimination is always hard, more so for EFD

- **Disparate treatment**: expected fertility $\overset{?}{\Rightarrow}$ employer decision
  - Identification: isolate the **causal effect** of fertility expectations on decisions
- Issue with expectations: function of worker observable characteristics
  - Vary expected fertility $\Rightarrow$ vary worker observables
  - Same observables signal **productivity**, experience, attachment
  - E.g. **age**: older workers less likely to have children, also more experienced

Identifying discrimination is always hard, more so for EFD

- **Disparate treatment**: expected fertility $\overset{?}{\Rightarrow}$ employer decision
  - Identification: isolate the **causal effect** of fertility expectations on decisions
- Issue with expectations: function of worker observable characteristics
  - Vary expected fertility $\Rightarrow$ vary worker observables
  - Same observables signal **productivity**, experience, attachment
  - E.g. **age**: older workers less likely to have children, also more experienced
- Identification from variation in fertility expectations requires **valid instrument**
  - Relevance: shifts fertility expectations
  - Exclusion: affects employer decisions **only via** fertility expectations

Identifying discrimination is always hard, more so for EFD

- **Disparate treatment**: expected fertility $\overset{?}{\Rightarrow}$ employer decision
  - Identification: isolate the **causal effect** of fertility expectations on decisions
- Issue with expectations: function of worker observable characteristics
  - Vary expected fertility $\Rightarrow$ vary worker observables
  - Same observables signal **productivity**, experience, attachment
  - E.g. **age**: older workers less likely to have children, also more experienced
- Identification from variation in fertility expectations requires **valid instrument**
  - Relevance: shifts fertility expectations
  - Exclusion: affects employer decisions **only via** fertility expectations
- Relevance–exclusion **trade-off**
  - Strongest fertility predictors, likely not excludable (age, education, married...)
  - Valid instruments, if any, capture only a small part of EFD

Identifying discrimination is always hard, more so for EFD

- **Disparate treatment**: expected fertility $\overset{?}{\Rightarrow}$ employer decision
  - Identification: isolate the **causal effect** of fertility expectations on decisions
- Issue with expectations: function of worker observable characteristics
  - Vary expected fertility $\Rightarrow$ vary worker observables
  - Same observables signal **productivity**, experience, attachment
  - E.g. **age**: older workers less likely to have children, also more experienced
- Identification from variation in fertility expectations requires **valid instrument**
  - Relevance: shifts fertility expectations
  - Exclusion: affects employer decisions **only via** fertility expectations
- Relevance–exclusion **trade-off**
  - Strongest fertility predictors, likely not excludable (age, education, married...)
  - Valid instruments, if any, capture only a small part of EFD
- Beyond EFD: discrimination based on any **inferred attribute**

This Paper

Identification from variation in **cost** of future fertility to employers

- If EFD present, $\uparrow$ cost $\Rightarrow$ differential employer response by expected fertility
- Captures EFD based on employers' **full information** set

This Paper

Identification from variation in **cost** of future fertility to employers

- If EFD present, $\uparrow$ cost $\Rightarrow$ differential employer response by expected fertility
- Captures EFD based on employers' **full information** set

Implementation: Pregnancy Discrimination Act of 1978 (PDA)

- $\uparrow$ protections for **pregnant** workers $\Rightarrow$ $\uparrow$ firms' exposure to fertility costs

This Paper

Identification from variation in **cost** of future fertility to employers

- If EFD present, ↑ cost ⇒ differential employer response by expected fertility
- Captures EFD based on employers' **full information** set

Implementation: Pregnancy Discrimination Act of 1978 (PDA)

- ↑ protections for **pregnant** workers ⇒ ↑ firms' exposure to fertility costs

Research Questions:

1. Do employers **discriminate** against women because of **expected fertility**?
2. How much are observed gaps in labor market outcomes explained by this?
3. How did the **PDA** affect the labor market?

Overview

Framework: labor market with fertility costs & heterogeneous fertility risk

- Identification of EFD via cost variation
- Equilibrium responses of employment, wages & gender gap to $\uparrow$ EFD

Overview

Framework: labor market with fertility costs & heterogeneous fertility risk

- Identification of EFD via cost variation
- Equilibrium responses of employment, wages & gender gap to ↑ EFD

Context: US labor market around PDA of 1978

- Pre: employers could fire women upon pregnancy, legal exception to sex-discrimination law
- Post: pregnancy discrimination illegal, employers anticipate costs of future fertility
- State variation: comparable state policies passed before 1978

Overview

Framework: labor market with fertility costs & heterogeneous fertility risk

- Identification of EFD via cost variation
- Equilibrium responses of employment, wages & gender gap to ↑ EFD

Context: US labor market around PDA of 1978

- Pre: employers could fire women upon pregnancy, legal exception to sex-discrimination law
- Post: pregnancy discrimination illegal, employers anticipate costs of future fertility
- State variation: comparable state policies passed before 1978

Data: Individual-level survey data on employment and fertility (CPS, PSID)

Empirical Strategy: DID comparing

- States first treated by the PDA in 1978
- States already treated in 1978 by own comparable policies

Preview of Results

PDA led to

- ↓ 7% **employment** of fertile-age women, driven by ↓ hiring, smaller wage ↓
- Effect **larger** for women with higher **expected fertility**
- No effect for women past fertile age, ↓ men's wages
- 27% wider gender **employment gap**

Preview of Results

PDA led to

- ↓ 7% **employment** of fertile-age women, driven by ↓ hiring, smaller wage ↓
- Effect **larger** for women with higher **expected fertility**
- No effect for women past fertile age, ↓ men's wages
- 27% wider gender **employment gap**

Equilibrium responses establish

- EFD is **present** after the PDA
- PDA-induced **increase** in EFD accounts for 27% of employment gap

Preview of Results

PDA led to

- ↓ 7% **employment** of fertile-age women, driven by ↓ hiring, smaller wage ↓
- Effect **larger** for women with higher **expected fertility**
- No effect for women past fertile age, ↓ men's wages
- 27% wider gender **employment gap**

Equilibrium responses establish

- EFD is **present** after the PDA
- PDA-induced **increase** in EFD accounts for 27% of employment gap
  - Pre-existing EFD **not** identified by PDA shock

  → 27% **lower bound** on overall contribution

Thomas, 2020, Fernández-Kranz et al., 2021, Ginja et al., 2023, Ghosh et al., 2025 ...
PDA: Gruber, 1994, Timpe, 2024

→ EFD present & strong even with limited maternity benefits

→ Policies ↑ firm fertility costs ⇒ unintended effects shaped by **expected fertility**

Conceptual Framework

Identifying EFD in Employer Decisions

Employers

- Observe workers' gender g and other characteristics z (age, education, race...)
- Form expectation about future pregnancy: $q(g, z) \in [0, 1]$
- Bear costs if future pregnancy happens $C \geq 0$

Identifying EFD in Employer Decisions

Employers

- Observe workers' gender g and other characteristics z (age, education, race...)
- Form expectation about future pregnancy: $q(g,z) \in [0,1]$
- Bear costs if future pregnancy happens $C \geq 0$

Employer decision to hire worker of type (g,z) at given wages function of

$$\underbrace{S(g,z;C)}_{\text{Hiring Surplus}} = \underbrace{MP(g,z)}_{\text{Marginal Product}} - \underbrace{w(g,z)}_{\text{Wages}} - \underbrace{q(g,z)C}_{\text{Expected Fertility Costs}}$$

Identifying EFD in Employer Decisions

Employers

- Observe workers' gender g and other characteristics z (age, education, race...)
- Form expectation about future pregnancy: $q(g,z) \in [0,1]$
- Bear costs if future pregnancy happens $C \geq 0$

Employer decision to hire worker of type (g,z) at given wages function of

$$\underbrace{S(g,z;C)}_{\text{Hiring Surplus}} = \underbrace{MP(g,z)}_{\text{Marginal Product}} - \underbrace{w(g,z)}_{\text{Wages}} - \underbrace{q(g,z)C}_{\substack{\text{Expected} \\ \text{Fertility Costs}}}$$

Target: proving that, *ceteris paribus*, different $q(g,z) \Rightarrow$ different decision

Identifying EFD in Employer Decisions

Employers

- Observe workers' gender g and other characteristics z (age, education, race...)
- Form expectation about future pregnancy: $q(g,z) \in [0,1]$
- Bear costs if future pregnancy happens $C \geq 0$

Employer decision to hire worker of type (g,z) at given wages function of

$$\underbrace{S(g,z;C)}_{\text{Hiring Surplus}} = \underbrace{MP(g,z)}_{\text{Marginal Product}} - \underbrace{w(g,z)}_{\text{Wages}} - \underbrace{q(g,z)C}_{\substack{\text{Expected} \\ \text{Fertility Costs}}}$$

Target: proving that, *ceteris paribus*, different $q(g,z) \Rightarrow$ different decision

Identification challenge:

- To vary $q(g,z)$, need to vary signals (g,z) (e.g., age, married...)
- Varying (g,z) may affect decisions also via $MP(g,z)$ or $w(g,z)$

Identification via Variation in Fertility Costs

Hiring decision under exogenous increase in fertility costs $C_0 \to C_1$

Identification via Variation in Fertility Costs

Hiring decision under exogenous increase in fertility costs $C_0 \rightarrow C_1$

- Marginal product and wages not affected

Identification via Variation in Fertility Costs

Hiring decision under exogenous increase in fertility costs $C_0 \to C_1$

- Marginal product and wages not affected
- Hiring surplus changes by **expected** increase in costs $-q(g,z)(C_1 - C_0)$

Identification via Variation in Fertility Costs

Hiring decision under exogenous increase in fertility costs $C_0 \to C_1$

- Marginal product and wages not affected
- Hiring surplus changes by **expected** increase in costs $-q(g,z)(C_1 - C_0)$

Change in hiring decisions due to $\uparrow$ fertility costs identifies

- Presence of EFD at C_1, based on all fertility signals (g,z) observed by employer

Identification via Variation in Fertility Costs

Hiring decision under exogenous increase in fertility costs $C_0 \to C_1$

- Marginal product and wages not affected
- Hiring surplus changes by **expected** increase in costs $-q(g,z)(C_1 - C_0)$

Change in hiring decisions due to $\uparrow$ fertility costs identifies

- Presence of EFD at C_1, based on all fertility signals (g,z) observed by employer
- Increase in EFD induced by $C_0 \to C_1$

Identification via Variation in Fertility Costs

Hiring decision under exogenous increase in fertility costs $C_0 \to C_1$

- Marginal product and wages not affected
- Hiring surplus changes by **expected** increase in costs $-q(g,z)(C_1 - C_0)$

Change in hiring decisions due to $\uparrow$ fertility costs identifies

- Presence of EFD at C_1, based on all fertility signals (g,z) observed by employer
- Increase in EFD induced by $C_0 \to C_1$

In practice, observe **equilibrium** effects of $\uparrow C$: employment/wage adjust across (g,z)

Identification via Variation in Fertility Costs

Hiring decision under exogenous increase in fertility costs $C_0 \to C_1$

- Marginal product and wages not affected
- Hiring surplus changes by **expected** increase in costs $-q(g,z)(C_1 - C_0)$

Change in hiring decisions due to $\uparrow$ fertility costs identifies

- Presence of EFD at C_1, based on all fertility signals (g,z) observed by employer
- Increase in EFD induced by $C_0 \to C_1$

In practice, observe **equilibrium** effects of $\uparrow C$: employment/wage adjust across (g,z)

- Good, interested in presence and consequences of EFD in equilibrium
- Need equilibrium model of labor market

Equilibrium Response to Increased Fertility Costs

Embed EFD framework in competitive model of labor market where firms

- Combine **gender** $\times$ **age** labor inputs as imperfect substitutes (Card et al., 2001)
- Hold expectations about future fertility based on gender $\times$ age

Equilibrium Response to Increased Fertility Costs

Embed EFD framework in competitive model of labor market where firms

- Combine **gender** $\times$ **age** labor inputs as imperfect substitutes (Card et al., 2001)
- Hold expectations about future fertility based on gender $\times$ age

Equilibrium EFD: **wedge** b/w marginal productivity & wage

$\downarrow$ Employment and wages for fertile-age women, regardless of actual future fertility

Equilibrium Response to Increased Fertility Costs

Embed EFD framework in competitive model of labor market where firms

- Combine **gender** $\times$ **age** labor inputs as imperfect substitutes (Card et al., 2001)
- Hold expectations about future fertility based on gender $\times$ age

Equilibrium EFD: **wedge** b/w marginal productivity & wage

$\downarrow$ Employment and wages for fertile-age women, regardless of actual future fertility

Equilibrium effects of $\uparrow$ fertility costs

- $\uparrow$ expected costs of employing fertile-age women $\Rightarrow$ $\uparrow$ **EFD**

Equilibrium Response to Increased Fertility Costs

Embed EFD framework in competitive model of labor market where firms

- Combine **gender** $\times$ **age** labor inputs as imperfect substitutes (Card et al., 2001)
- Hold expectations about future fertility based on gender $\times$ age

Equilibrium EFD: **wedge** b/w marginal productivity & wage

$\downarrow$ Employment and wages for fertile-age women, regardless of actual future fertility

Equilibrium effects of $\uparrow$ fertility costs

- $\uparrow$ expected costs of employing fertile-age women $\Rightarrow$ $\uparrow$ **EFD**
- **Fertile-age women**: employment $\downarrow$, wages $\downarrow$

Equilibrium Response to Increased Fertility Costs

Embed EFD framework in competitive model of labor market where firms

- Combine **gender** $\times$ **age** labor inputs as imperfect substitutes (Card et al., 2001)
- Hold expectations about future fertility based on gender $\times$ age

Equilibrium EFD: **wedge** b/w marginal productivity & wage

$\downarrow$ Employment and wages for fertile-age women, regardless of actual future fertility

Equilibrium effects of $\uparrow$ fertility costs

- $\uparrow$ expected costs of employing fertile-age women $\Rightarrow$ $\uparrow$ **EFD**
- **Fertile-age women**: employment $\downarrow$, wages $\downarrow$
- **Men** and **older women**: sign ambiguous
  - For men, $\downarrow$ if (q-)complements across gender, $\uparrow$ if substitutes

Setting

US Federal Gender Discrimination Laws

1963–64 Equal Pay Act & Title VII of Civil Rights Act

- Gender discrimination in employment prohibited
- Pregnancy discrimination **not explicitly** addressed

US Federal Gender Discrimination Laws

1963–64 **Equal Pay Act** & **Title VII of Civil Rights Act**

- Gender discrimination in employment prohibited
- Pregnancy discrimination **not explicitly** addressed

1970s

Federal level (Supreme Court, 1974, 1976)	**State level**
Pregnancy discrimination $\neq$ gender discrimination $\Rightarrow$ **not covered by Title VII**	16 states independently $\uparrow$ employment protection of pregnant workers

US Federal Gender Discrimination Laws

1963–64 **Equal Pay Act & Title VII of Civil Rights Act**

- Gender discrimination in employment prohibited
- Pregnancy discrimination **not explicitly** addressed

1970s

Federal level (Supreme Court, 1974, 1976)	**State level**
Pregnancy discrimination $\neq$ gender discrimination $\Rightarrow$ **not covered by Title VII**	16 states independently $\uparrow$ employment protection of pregnant workers

1978 **Pregnancy Discrimination Act**

State Policies Context

Pregnancy Discrimination Act of 1978

- Passed on October 31, 1978, with strong bipartisan support
- Equal treatment of pregnant & other workers w/ comparable temporary disabilities
  - *De jure*, in all aspects of employment
  - *De facto*, enforceable in terms of **employment protection**
  - No special provisions or mandated benefits
- Enforced by the Equal Employment Opportunity Commission (EEOC)
  - **Discriminatory dismissal** most common type of case based on the PDA
  - Only type with high rates of success for workers (Edwards, 1996)

PDA as Increase in Fertility Costs

Fertility costs C depend on employer decision upon pregnancy between

- Dismiss worker & pay **dismissal cost**
- Retain worker & pay **retention cost** while worker temporarily out of active work

PDA as Increase in Fertility Costs

Fertility costs C depend on employer decision upon pregnancy between

- Dismiss worker & pay **dismissal cost**
- Retain worker & pay **retention cost** while worker temporarily out of active work

PDA sanctions discriminatory dismissal of **pregnant** workers

- Pre-PDA: firms dismiss pregnant workers

PDA as Increase in Fertility Costs

Fertility costs C depend on employer decision upon pregnancy between

- Dismiss worker & pay **dismissal cost**
- Retain worker & pay **retention cost** while worker temporarily out of active work

PDA sanctions discriminatory dismissal of **pregnant** workers

- Pre-PDA: firms dismiss pregnant workers
  - Maternity benefits rare
  - Costs due to 'inherent' pregnancy costs (replacement, accommodations, productivity)
  - Firms partially avoid them by dismissal

PDA as Increase in Fertility Costs

Fertility costs C depend on employer decision upon pregnancy between

- Dismiss worker & pay **dismissal cost**
- Retain worker & pay **retention cost** while worker temporarily out of active work

PDA sanctions discriminatory dismissal of **pregnant** workers

- Pre-PDA: firms dismiss pregnant workers
  - Maternity benefits rare
  - Costs due to 'inherent' pregnancy costs (replacement, accommodations, productivity)
  - Firms partially avoid them by dismissal
- Post-PDA:
  - Dismiss $\longrightarrow$ higher dismissal cost
  - Retain $\longrightarrow$ pre-existing retention cost

PDA as Increase in Fertility Costs

Fertility costs C depend on employer decision upon pregnancy between

- Dismiss worker & pay **dismissal cost**
- Retain worker & pay **retention cost** while worker temporarily out of active work

PDA sanctions discriminatory dismissal of **pregnant** workers

- Pre-PDA: firms dismiss pregnant workers
  - Maternity benefits rare
  - Costs due to 'inherent' pregnancy costs (replacement, accommodations, productivity)
  - Firms partially avoid them by dismissal
- Post-PDA:
  - Dismiss $\longrightarrow$ higher dismissal cost
  - Retain $\longrightarrow$ pre-existing retention cost

$\Big\}$ $\uparrow$ **fertility costs**

PDA as Increase in Fertility Costs

Fertility costs C depend on employer decision upon pregnancy between

- Dismiss worker & pay **dismissal cost**
- Retain worker & pay **retention cost** while worker temporarily out of active work

PDA sanctions discriminatory dismissal of **pregnant** workers

- Pre-PDA: firms dismiss pregnant workers
  - Maternity benefits rare
  - Costs due to 'inherent' pregnancy costs (replacement, accommodations, productivity)
  - Firms partially avoid them by dismissal
- Post-PDA:
  - Dismiss $\rightarrow$ higher dismissal cost
  - Retain $\rightarrow$ pre-existing retention cost

  } $\uparrow$ **fertility costs**
- PDA increases firm exposure to pre-existing 'inherent' pregnancy costs

Data & Empirical Strategy

Data

Policy variation: all pre-1978 **state** policies on employment of pregnant women

CPS Annual Social and Economic Supplement (ASEC)

- Yearly cross-section from 1962
- Limitation: states grouped until 1976

Panel Study of Income Dynamics (PSID)

- Yearly panel from 1968
- Smaller sample, states separately identified

Main Sample: women 18-35 to match fertility cycle in 1970s-80s

Empirical Strategy

Identification: DID around passage of **PDA** in 1978 comparing

- **PDA-treated** states: treated by PDA
- **PDA-control** states: treated by pre-PDA state policies

Empirical Strategy

Identification: DID around passage of **PDA** in 1978 comparing

- **PDA-treated** states: treated by PDA
- **PDA-control** states: treated by pre-PDA state policies

Assumption: absent the PDA, outcomes in **PDA-treated** and **PDA-control** states would have evolved in **parallel** before and after 1978

Empirical Strategy

Identification: DID around passage of **PDA** in 1978 comparing

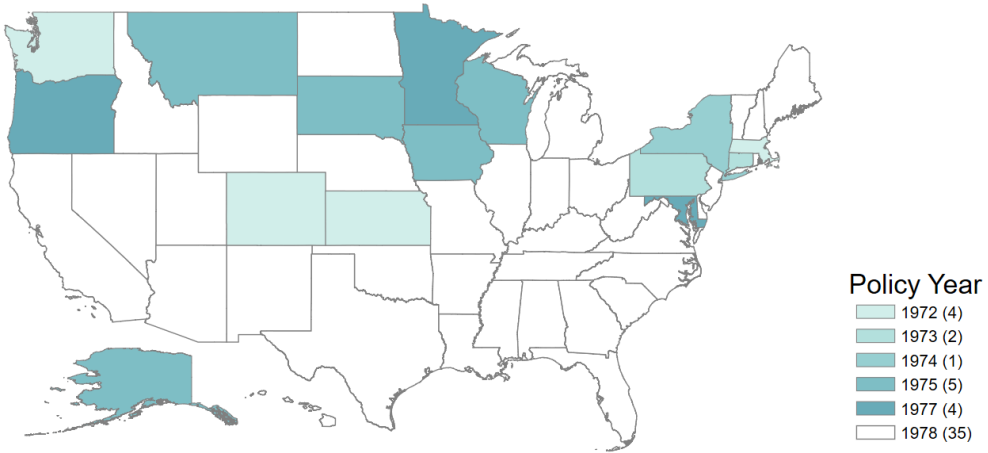

- **PDA-treated** states: treated by PDA
- **PDA-control** states: treated by pre-PDA state policies

Assumption: absent the PDA, outcomes in **PDA-treated** and **PDA-control** states would have evolved in **parallel** before and after 1978

→ Requires **constant** effects of pre-PDA policies around 1978

→ Exclude PDA-control states treated **close** to 1978

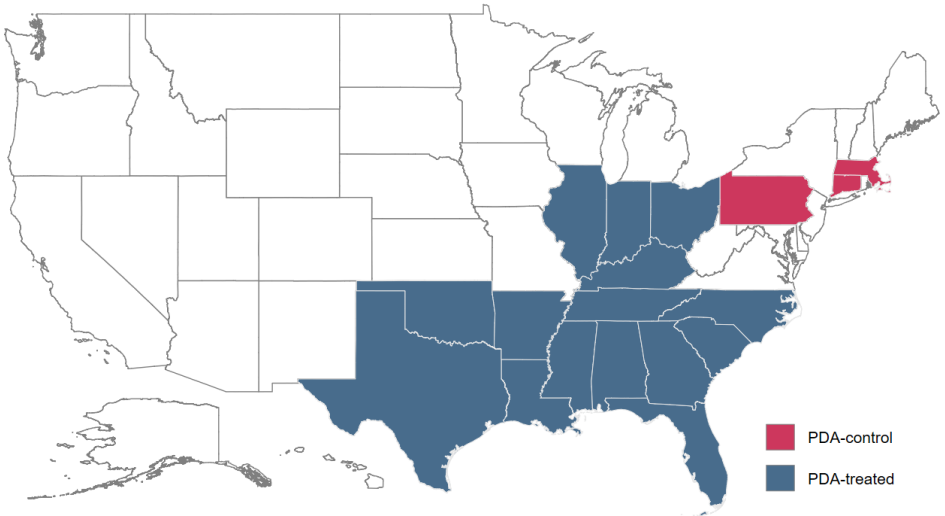

State Policies Protecting Employment of Pregnant Workers

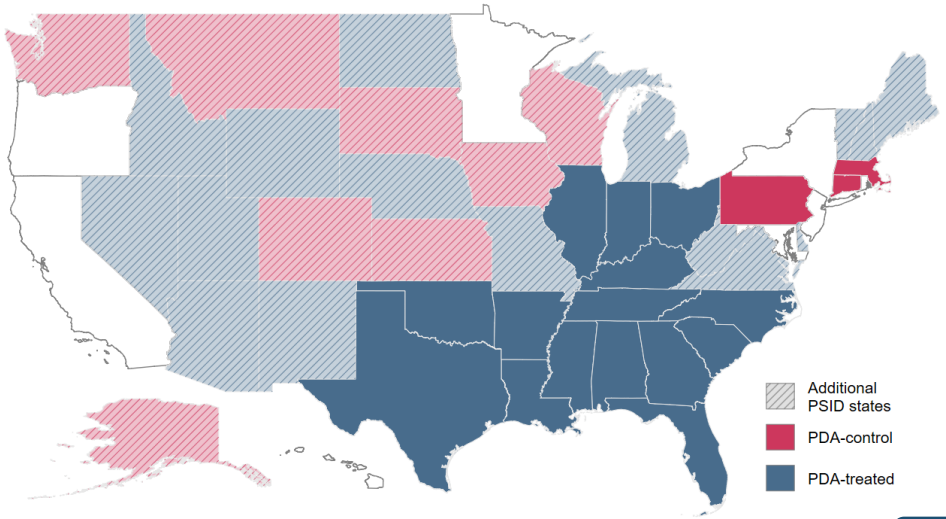

All pre-PDA **state policies** provide **equal** or **stronger** protections than the PDA

Policies ◂ Context

Main Sample: PDA-treated and PDA-control (treated $\leq$ 1973)

Main Sample: PDA-treated and PDA-control (treated $\leq$ 1973)

PSID States

Estimating Equation

Sample: individuals in PDA-treated and PDA-control states, from 1973 to 1984

$$y_{i,s,t} = \beta \boldsymbol{T_s} \times \boldsymbol{P_t} + \theta_s + \delta_t + \Gamma X_{i,s,t} + \varepsilon_{i,s,t}$$

i : individual, s : state, t : year

$y_{i,s,t}$: outcome of interest

T_s: **PDA-treated** dummy

P_t: **Post-PDA** dummy ($t > 1978$)

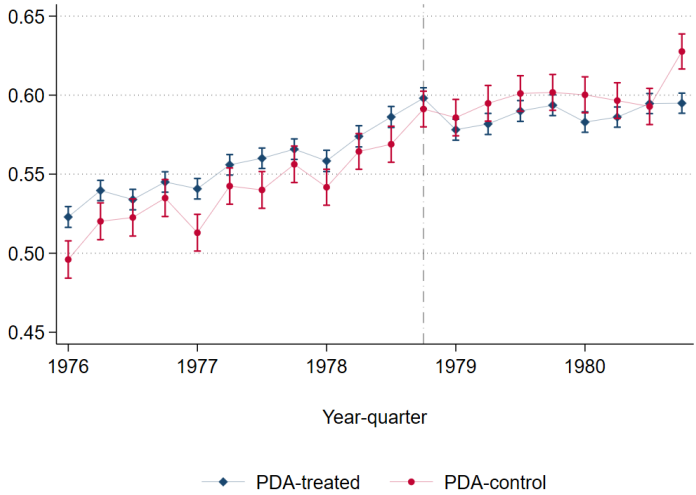

θ_s: State FE, δ_t: Year FE

$X_{i,s,t}$: individual-level controls (race, education, age, marital status, metro-area)

Separately estimated for: **Women 18-35**, Women 40-60, Men 18-60

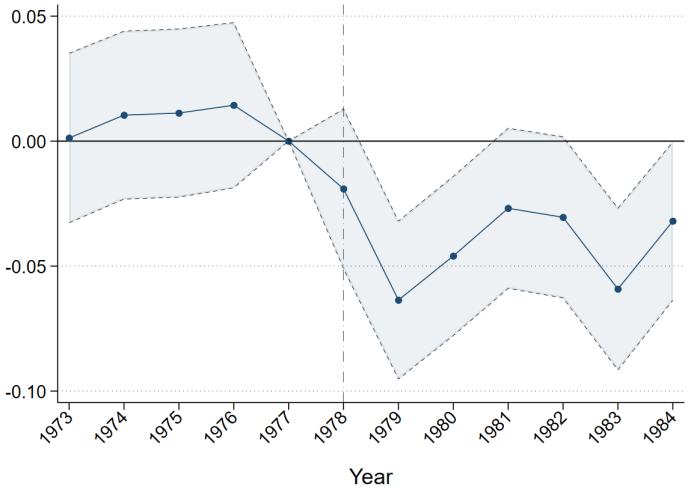

Effects of the PDA

Raw Data: ↓ Employment of Fertile-Age Women Right After PDA

Notes: Women 18-35 in PDA-treated and PDA-control states. 95% CI based on robust s.e. Basic Monthly CPS, monthly estimates aggregated at the quarterly level.

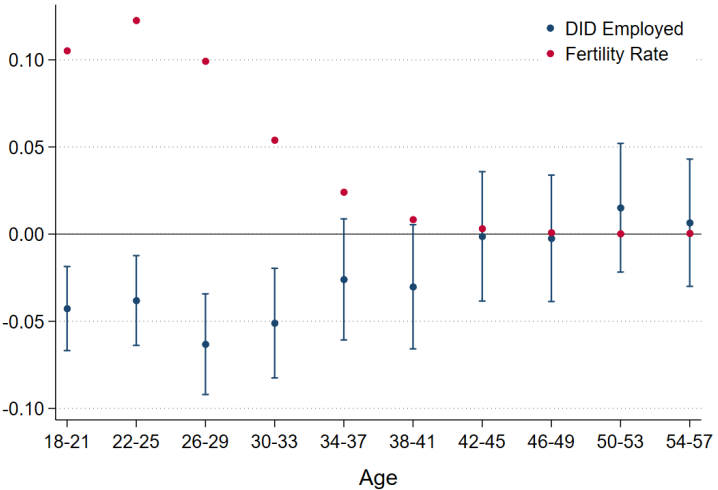

Event-Study: Employment Decline is Rapid and Large

↓ 7% employment of fertile-age women

Notes: Data from CPS ASEC. Sample restricted to women 18-35 in PDA-treated and PDA-control states. 95% CI based on robust s.e.

Employment Effect Driven by Women with Higher Expected Fertility

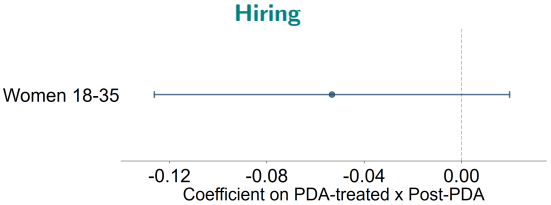

Notes: CPS ASEC, OLS estimates, 95% CI based on robust s.e.

↓ employment only at ages w/ fertility risk > 0

$\Rightarrow$ Evidence of EFD

Predicted Fertility Men

Decline in Hiring and Evidence on Dismissals After Pregnancy

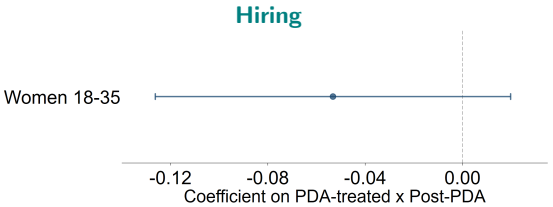

Notes: PSID. OLS estimates, 95% CI.

Hiring

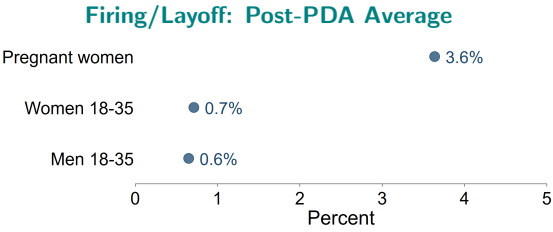

- Measure: non-employed at $t-1$, employed at t
- Large imprecise decline $-5.3pp$ (-19%)

Table CPS | Table PSID

Decline in Hiring and Evidence on Dismissals After Pregnancy

Notes: PSID. OLS estimates, 95% CI.

Hiring

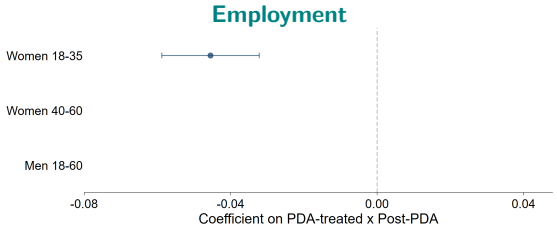

- Measure: non-employed at $t-1$, employed at t
- Large imprecise decline $-5.3pp$ (-19%)

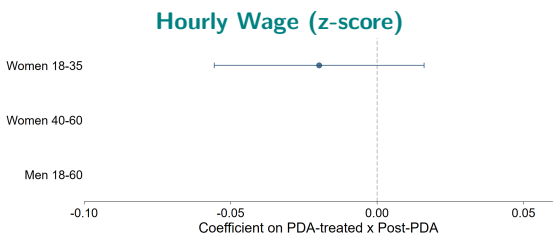

Firing and layoffs after pregnancy

- Only observed in PSID since 1979
- Still frequent after PDA
  - 9% of post-childbirth job separations
  - $5-6x$ more frequent than avg individual aged 18-35

Table CPS Table PSID

Wages and Spillovers to Men

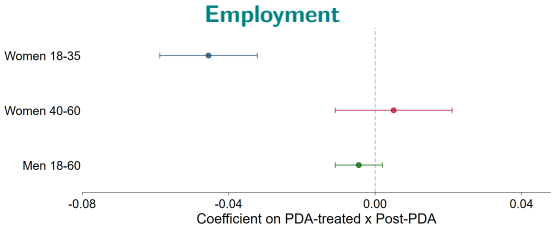

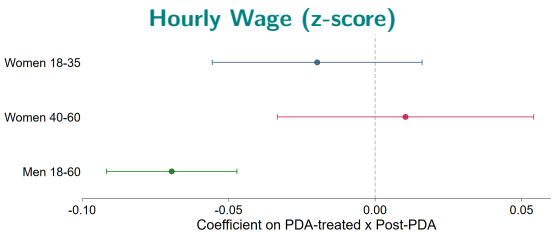

Notes: CPS ASEC. OLS estimates, 95% CI.

Fertile-age women

- Smaller wage ↓, consistent with
  - Elastic labor supply (Elder et al., 2025)
  - Wage rigidities from equal pay law

Wages and Spillovers to Men

Notes: CPS ASEC. OLS estimates, 95% CI.

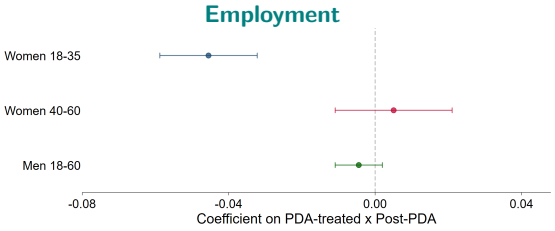

Fertile-age women

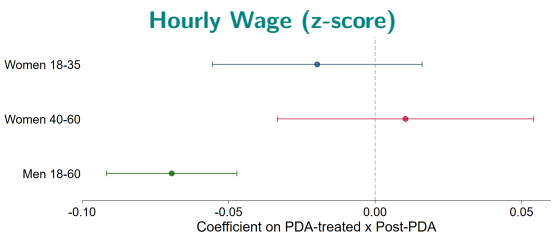

- Smaller wage ↓, consistent with
  - Elastic labor supply (Elder et al., 2025)
  - Wage rigidities from equal pay law

Spillovers

- Older women: response ≈ 0

Wages and Spillovers to Men

Notes: CPS ASEC. OLS estimates, 95% CI.

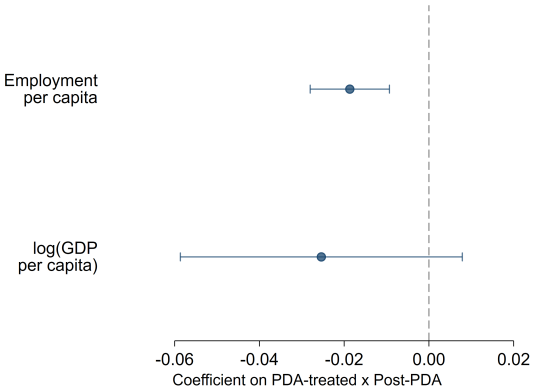

Fertile-age women

- Smaller wage ↓, consistent with
  - Elastic labor supply (Elder et al., 2025)
  - Wage rigidities from equal pay law

Spillovers

- Older women: response ≈ 0
- Men: ↓ mostly via wages, consistent with
  - q-Complementarity with women
  - Inelastic labor supply
  - Emp-to-pop rate ≈ 90%

Aggregate Decline in Employment & GDP

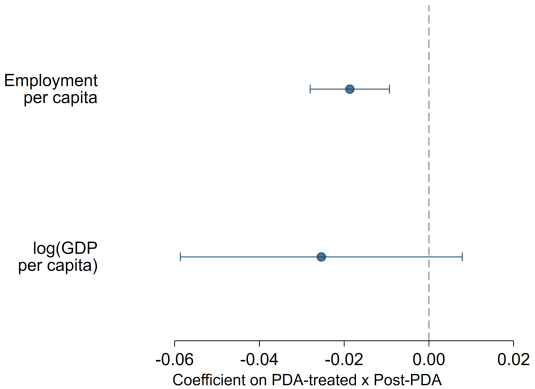

Aggregate employment response

- $\downarrow$ fertile-age women (28% workforce)
- ≈ 0 men, older women

$\rightarrow$ $-1.9pp$ employment-to-population

(County Business Patterns Data)

Aggregate Decline in Employment & GDP

Aggregate employment response

- $\downarrow$ fertile-age women (28% workforce)
- ≈ 0 men, older women

$\rightarrow$ $-1.9pp$ employment-to-population

(County Business Patterns Data)

State GPD per capita $\approx -2.5\%$ (BEA data)

- In range of responses to employment protection (Autor et al., 2007; Bjuggren, 2018)
- Slightly smaller than implied by elasticity of GDP to Labor (Vollrath, 2024)

Robustness and Other Results

Robustness checks:

- Dropping one state at a time Plot
- PDA quasi-experiment using larger set of states with PSID Table Map
- Estimates using childhood state of residence with PSID Table
- Alternative identification strategy Table
- Higher frequency measure of employment from monthly CPS Table
- Controlling for contemporaneous policies Plot
- Health benefits expansion Benefits

Other Results:

- Mechanisms EPA
- Additional Outcomes Table
- Effects for married women Table
- Effects by ethnicity Table

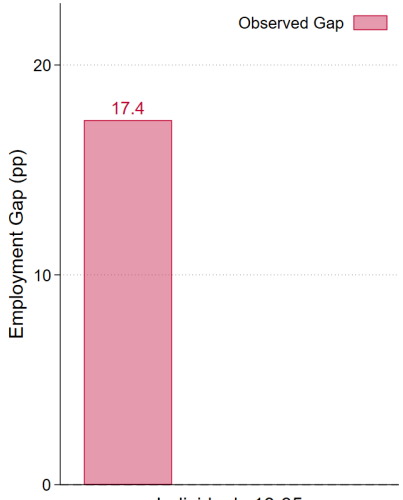

Quantification End

Quantification

Quantifying Expected-Fertility Discrimination: A Lower Bound

Compare gender employment gaps at age 18–35:

- Observed unconditional gap **with PDA**

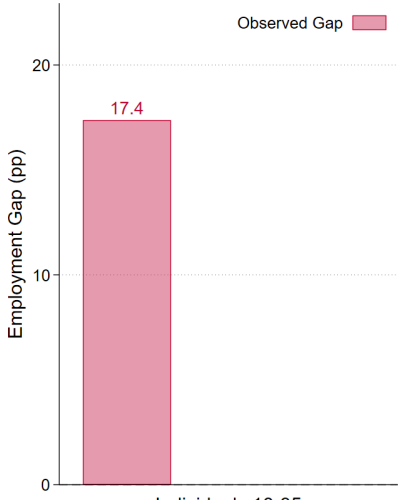

Notes: CPS ASEC data.

Quantifying Expected-Fertility Discrimination: A Lower Bound

Compare gender employment gaps at age 18–35:

- Observed unconditional gap **with PDA**
- Use **unconditional** gap. Why?
  - Employer expectations based on characteristics (age, education...)
  - Characteristics are *used* to discriminate
  - Variation is part of EFD

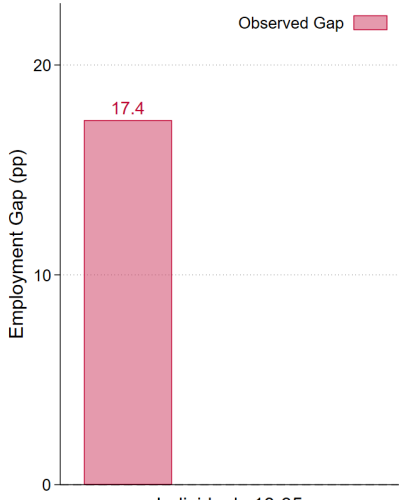

Notes: CPS ASEC data.

Quantifying Expected-Fertility Discrimination: A Lower Bound

Compare gender employment gaps at age 18–35:

- Observed unconditional gap **with PDA**

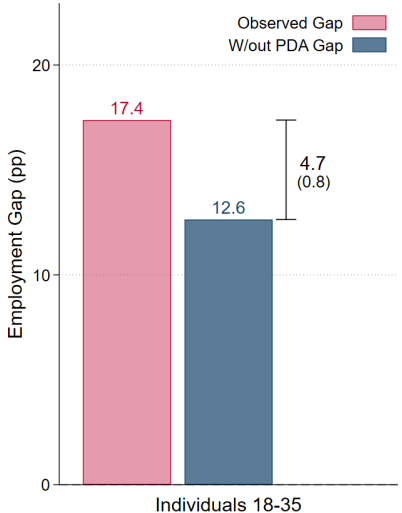

Notes: CPS ASEC data.

Quantifying Expected-Fertility Discrimination: A Lower Bound

Compare gender employment gaps at age 18–35:

- Observed unconditional gap **with PDA**
- Counterfactual gap **without PDA**

→ PDA-induced EFD: 4.7*pp* larger gap (27%)

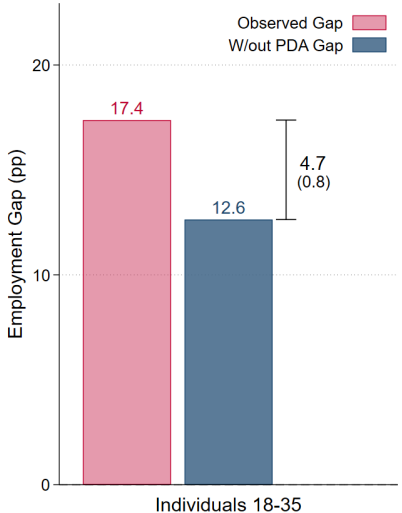

Notes: CPS ASEC data. Robust s.e.

Quantifying Expected-Fertility Discrimination: A Lower Bound

Compare gender employment gaps at age 18–35:

→ PDA-induced EFD: 4.7*pp* larger gap (27%)

Notes: CPS ASEC data. Robust s.e.

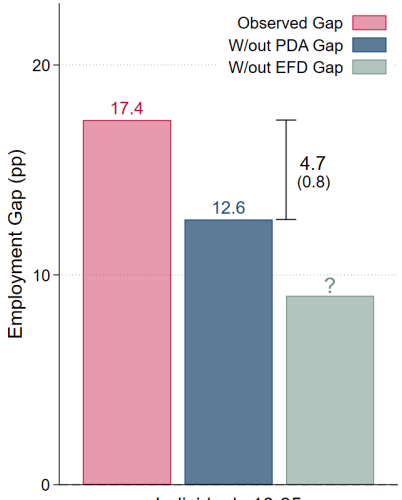

Quantifying Expected-Fertility Discrimination: A Lower Bound

Compare gender employment gaps at age 18–35:

→ PDA-induced EFD: 4.7*pp* larger gap (27%)

Lower bound on EFD contribution

- Counterfactual still includes expected fertility costs

Notes: CPS ASEC data. Robust s.e.

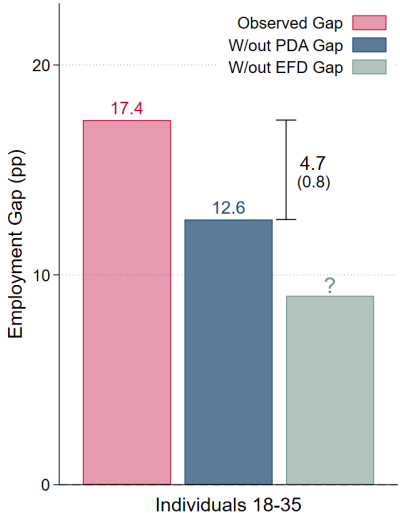

Quantifying Expected-Fertility Discrimination: A Lower Bound

Compare gender employment gaps at age 18–35:

→ PDA-induced EFD: 4.7*pp* larger gap (27%)

Lower bound on EFD contribution

- Counterfactual still includes expected fertility costs
- Condition: removing all such costs ⇒ smaller gap

Notes: CPS ASEC data. Robust s.e.

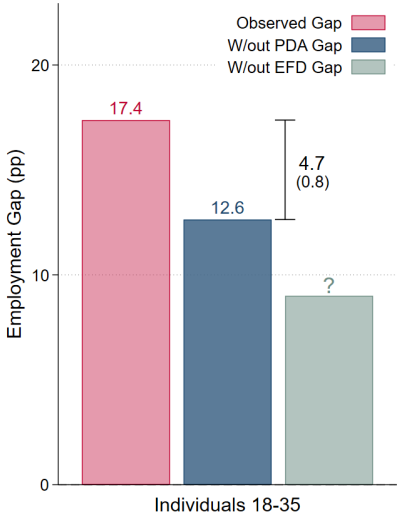

Quantifying Expected-Fertility Discrimination: A Lower Bound

Compare gender employment gaps at age 18–35:

→ PDA-induced EFD: 4.7*pp* larger gap (27%)

Lower bound on EFD contribution

- Counterfactual still includes expected fertility costs
- Condition: removing all such costs ⇒ smaller gap
  - Not guaranteed: men's employment may ↓

Notes: CPS ASEC data. Robust s.e.

Quantifying Expected-Fertility Discrimination: A Lower Bound

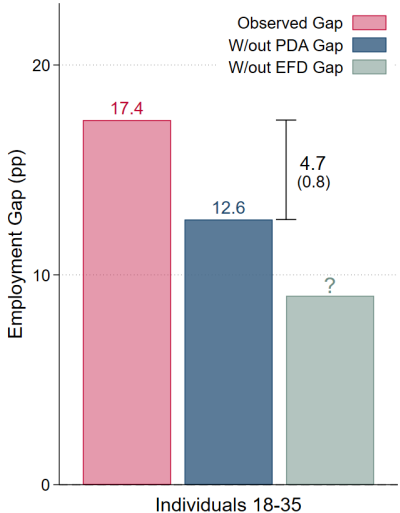

Compare gender employment gaps at age 18–35:

→ PDA-induced EFD: 4.7*pp* larger gap (27%)

Lower bound on EFD contribution

- Counterfactual still includes expected fertility costs
- Condition: removing all such costs ⇒ smaller gap
  - Not guaranteed: men's employment may ↓
  - Calibration to data and literature estimates

  → Holds across plausible parameterizations

Notes: CPS ASEC data. Robust s.e.

Quantifying Expected-Fertility Discrimination: A Lower Bound

Compare gender employment gaps at age 18–35:

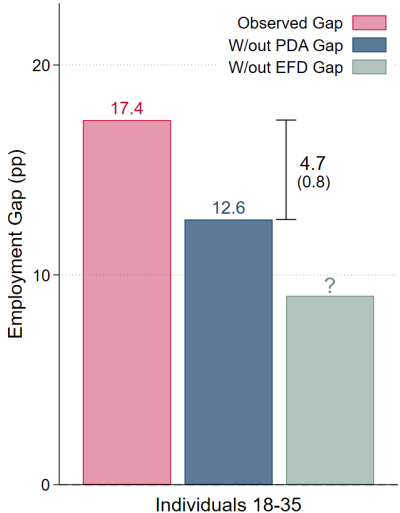

→ PDA-induced EFD: 4.7*pp* larger gap (27%)

Lower bound on EFD contribution

- Counterfactual still includes expected fertility costs
- Condition: removing all such costs ⇒ smaller gap
  - Not guaranteed: men's employment may ↓
  - Calibration to data and literature estimates

  → Holds across plausible parameterizations

EFD explains ≥ 27% of gender employment gap

Notes: CPS ASEC data. Robust s.e.

Takeaways

Conclusion

- PDA $\Rightarrow \downarrow 7\%$ employment of fertile-age women
- **Expected-fertility discrimination** explained $\geq 27\%$ gender **employment** gap

Conclusion

- PDA $\Rightarrow \downarrow 7\%$ employment of fertile-age women
- **Expected-fertility discrimination** explained $\geq 27\%$ gender **employment** gap
- **Today:** evidence suggests employment, hiring, and wage gaps still explained by EFD
  (Gallen, 2023; Bamieh et al., 2023; Landais et al., 2026)

Conclusion

- PDA $\Rightarrow \downarrow 7\%$ employment of fertile-age women
- **Expected-fertility discrimination** explained $\geq 27\%$ gender **employment** gap
- **Today:** evidence suggests employment, hiring, and wage gaps still explained by EFD
  (Gallen, 2023; Bamieh et al., 2023; Landais et al., 2026)
- EFD is still relevant. **Why?** Since 1978,

Conclusion

- PDA $\Rightarrow \downarrow 7\%$ employment of fertile-age women
- **Expected-fertility discrimination** explained $\geq 27\%$ gender **employment** gap
- **Today:** evidence suggests employment, hiring, and wage gaps still explained by EFD
  (Gallen, 2023; Bamieh et al., 2023; Landais et al., 2026)
- EFD is still relevant. **Why?** Since 1978,
  - Higher protections/benefits for recent mothers $\Rightarrow \uparrow$ costs of fertility to firms
  - Changes in social norms and work environments $\Rightarrow \uparrow$ employment after childbirth $\Rightarrow \downarrow$ costs of fertility

Conclusion

- PDA $\Rightarrow \downarrow 7\%$ employment of fertile-age women
- **Expected-fertility discrimination** explained $\geq 27\%$ gender **employment** gap
- **Today:** evidence suggests employment, hiring, and wage gaps still explained by EFD
  (Gallen, 2023; Bamieh et al., 2023; Landais et al., 2026)
- EFD is still relevant. **Why?** Since 1978,
  - Higher protections/benefits for recent mothers $\Rightarrow \uparrow$ costs of fertility to firms
  - Changes in social norms and work environments $\Rightarrow \uparrow$ employment after childbirth $\Rightarrow \downarrow$ costs of fertility

1960s-1980s: Contemporaneous Trends

The "*Quiet Revolution*" (Goldin, 2006)

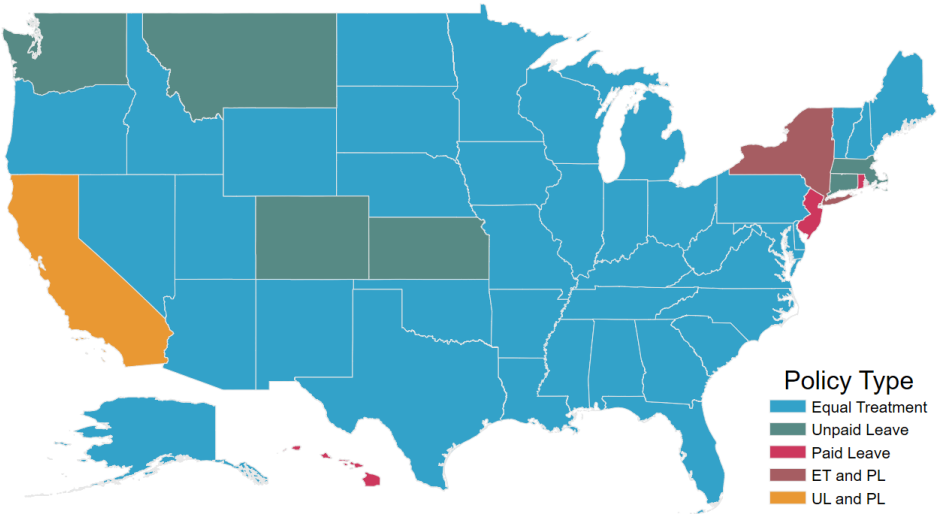

- Decades of strong ↑ female labor force participation (LFP)
  - → especially pronounced for fertile-age women, whose LFP rates had stagnated before the 1960s (Blau, 2024)
- ↑ female enrollment in higher education
- ↑ age at first marriage and childbirth, ↓ fertility rates
- Two pivotal factors:
  - birth control pill (FDA approved: 1960, widespread availability early 1970s)
  - states' unilateral divorce laws

\+ Male LFP rates and real wages slowly ↓

\+ The *noisier revolution*: women's and civil rights movements

Job Protection vs Health Benefits

PDA: equal treatment of pregnancy and comparable temporary disabilities

- Job protection

Job Protection vs Health Benefits

PDA: equal treatment of pregnancy and comparable temporary disabilities

- Job protection
- Health benefits: insurance (Gruber, 1994), paid sick leave (Timpe, 2024)

Job Protection vs Health Benefits

PDA: equal treatment of pregnancy and comparable temporary disabilities

- Job protection
- Health benefits: insurance (Gruber, 1994), paid sick leave (Timpe, 2024)
  - $\uparrow$ costs of employing fertile-age women $\Rightarrow \downarrow$ employment
  - valued by workers $\Rightarrow \uparrow$ employment

Job Protection vs Health Benefits

PDA: equal treatment of pregnancy and comparable temporary disabilities

- Job protection
- Health benefits: insurance (Gruber, 1994), paid sick leave (Timpe, 2024)
  - ↑ costs of employing fertile-age women ⇒ ↓ employment
  - valued by workers ⇒ ↑ employment
  - but only if provided to other workers as well!

Job Protection vs Health Benefits

Exploit Pre-PDA variation in employer-provided health benefits by **industry**

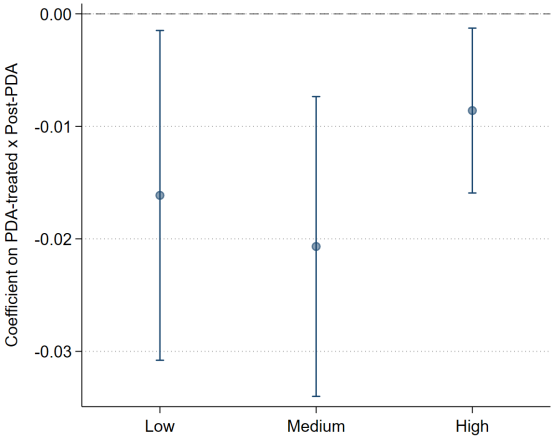

- **Low-coverage** industries: effect of the PDA from ↑ job protection
- **High-coverage** industries: additional effect of health benefits

Job Protection vs Health Benefits

Exploit Pre-PDA variation in employer-provided health benefits by **industry**

- **Low-coverage** industries: effect of the PDA from ↑ job protection
- **High-coverage** industries: additional effect of health benefits

Effect on Employment by Industry-level Coverage

Notes: OLS estimates on CPS ASEC data, 95% CI based on robust s.e. Data on health benefits from 1976 Survey of Income and Education.

◂ Main DID ◂ Robustness EPA

How Did Firms Respond to the PDA?

PDA $\uparrow$ costs of employing fertile-age women $\Rightarrow$ employers could respond via:

- Hiring $\downarrow$
- Wages $\downarrow$

How Did Firms Respond to the PDA?

PDA $\uparrow$ costs of employing fertile-age women $\Rightarrow$ employers could respond via:

- Hiring $\downarrow$
- Wages $\downarrow$

$\rightarrow$ Some employers faced constraints to adjustment on the wage margin due to the **Equal Pay Act**

How Did Firms Respond to the PDA?

PDA $\uparrow$ costs of employing fertile-age women $\Rightarrow$ employers could respond via:

- Hiring $\downarrow$
- Wages $\downarrow$

$\rightarrow$ Some employers faced constraints to adjustment on the wage margin due to the **Equal Pay Act**

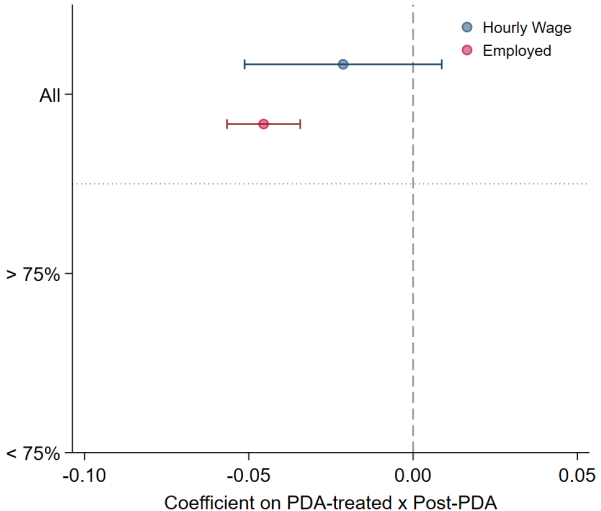

$\rightarrow$ Wages of men and women in the same firm-position had to be **equal**

$\Rightarrow$ Women's wages could only adjust if men's wages did too!

How Did Firms Respond to the PDA?

Exploit variation in **strength** of **EPA constraints** comparing industries where **Share Female**

- $> 75\% \rightarrow$ mostly women employed, low *bite* of EPA
- $< 75\% \rightarrow$ men's wages limit adjustments

Notes: OLS estimates, 95% CI based on robust s.e.

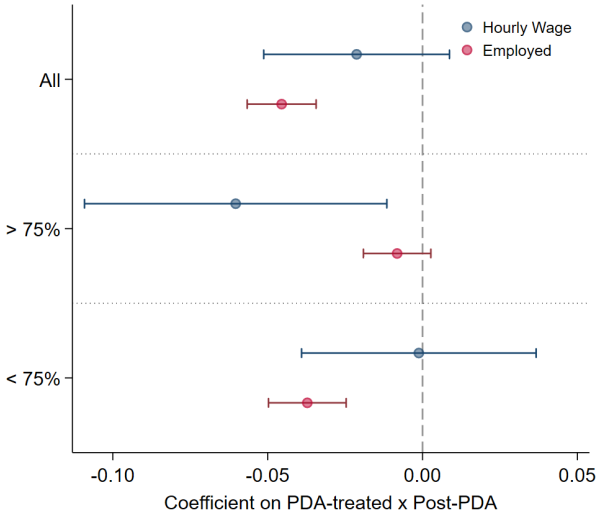

How Did Firms Respond to the PDA?

Exploit variation in **strength** of **EPA constraints** comparing industries where **Share Female**

- $> 75\%$ → mostly women employed, low *bite* of EPA
- $< 75\%$ → men's wages limit adjustments

Industries where EPA constraints

- Weak → response on **wages**
- Strong → response on **employment**

Notes: OLS estimates, 95% CI based on robust s.e.
